OXYG3N

IT Security Services
by GB3 Limited

OXYG3N assisted Vacant Property Specialists, one of the UK's largest vacant property security companies, to secure their online presence. The outcome was security assurance of multiple VPS websites.

OXYG3N consultants supported the Chief Information Officer by conducting industry leading penetration tests on the websites. The tests allowed us to review the current level of security, recommend improvements and then working with VPS resolve any security improvements suggested.

VPS GROUP

For the past ten years, VPS have been trusted to secure, maintain and manage vacant properties on behalf of a wide range of customers around the world. With locations in the UK, the US and across Europe, their social, corporate and private customers rely on our expert services to reduce costs and maintain the value of their vacant property over the long-term.

Providing far more than security, the innovative products and expert services allow customers to protect their vacant properties against unauthorised access and property decay.

With website attacks and cyber-crime ever increasing, the CIO at VPS Group undertook a significant review of their online security to protect VPS IP and customers data.

WHAT WE DID

Joe Elding, OXYG3N's Technical Director, identified the scope of the exercise and reviewed the website landscape. Identifying not only brochure sites we brought extranets, systems and associated companies in to the scope of the exercise. OXYG3N are well placed to identify areas for security review that often get overlooked.

Following the initial scope being agreed with VPS we began the penetration tests using our highly accredited and respected resources. The results of the penetration tests were securely and discreetly shared with the CIO of VPS. In this instance the websites were found to be secure with some suggestions for security improvements.

These improvements were then implemented by OXYG3N to ensure that the websites were continuously improving their security levels. Employee details, financial files and Customer data records all fell within these information assets, this meant the scope included a considerable amount of confidential information. Reliable and auditable controls and procedures needed to be implemented to protect these information assets.

OUTCOME

VPS understood why independent assessment of the website security was important and how it assures their data is secure. OXYG3N made sure that VPS had a clear understanding of the penetration system tests and the benefits that continuously improving their security would bring.

A reduction in security incidents, a clear business differentiator and also the ability to respond to tenders knowing that they not only take great care of their customer's vacant properties but also their data.

OXYG3N continues to support VPS with their website security and as the business develops we are actively engaged to bring continuous improvement to their Cyber Security
